# Classical architecture

## Ofono based Java RIL

## Why using Ofono based Java RIL?

- Adds supports for AT modems, could be used to support many devices:
  - GTA04: Free software bootloader
  - Optimus black: Free software bootloader
  - PinePhone (EG25 modem?): Will probably have a free software bootloader
  - Librem 5 (EG25 modem?): Free software bootloader, nonfree firmware for the DDR4 controller[1] on a flash chip → No redistribution issues for Replicant.
- Already has QMI support. Could be used add support for 4G with the following devices:
  - Galaxy SIII 4G (I9305)
  - Galaxy Note II 4G (N7105)

## Status

- Already tested on Replicant 6 with a smartphone that uses a Qualcomm System On a Chip (SOC)
- Tested with Voice calls, SMS, MMS, USSD, data, SIM ID, voicemail[3]

## oFono Sustainability

- Ofono is Maintained, has several modems and protocols
- Supports GNU/Linux modems (Smartphones with free software bootloaders often run GNU/Linux)

## oFono based Java RIL

- BuildRilWrapper.java[2] seem to use introspection to build the Framework $\leftrightarrow$  RIL API.
- Last commit from 2017
- Written in Java  $\rightarrow$  We would need more people fluent in Java.
