In order to simplify the backup instructions, it would be a good idea to have the EFS be always mounted at the same location, regardless of which device is used.

To do that we first need to document where the EFS is mounted, for each device.

Then we need to choose where the EFS will be mounted. /efs is a good candidate for that.

The we will need to modify the following to move the mount point:

- the system fstab will need to be adjusted
- libsamsung-ipc will need to be modified to be able to search multiples paths for the EFS mount point
- The backup instructions will need to be modified to remove device specific backup paths
